FINAL PROJECT PARAGRAPH AND WIREFRAME

For this project I wanted to do something for the weather in East Lansing. So I used two different API's, one being a public API and the other being a supabase table. The public API automatically updates every day with the weather for the next 7 days at 12pm and 12am. The Supabase table shows the historical average weather for the days 4/22-4/28. I decided on these 2 apis because I wanted to have a table that I made myself along with a table that takes data from a public API that is updated every time you access the site.
